Surgery Can Save Lives

Effects of Bariatric Surgery on Mortality in Swedish Obese Subjects

No. at Risk

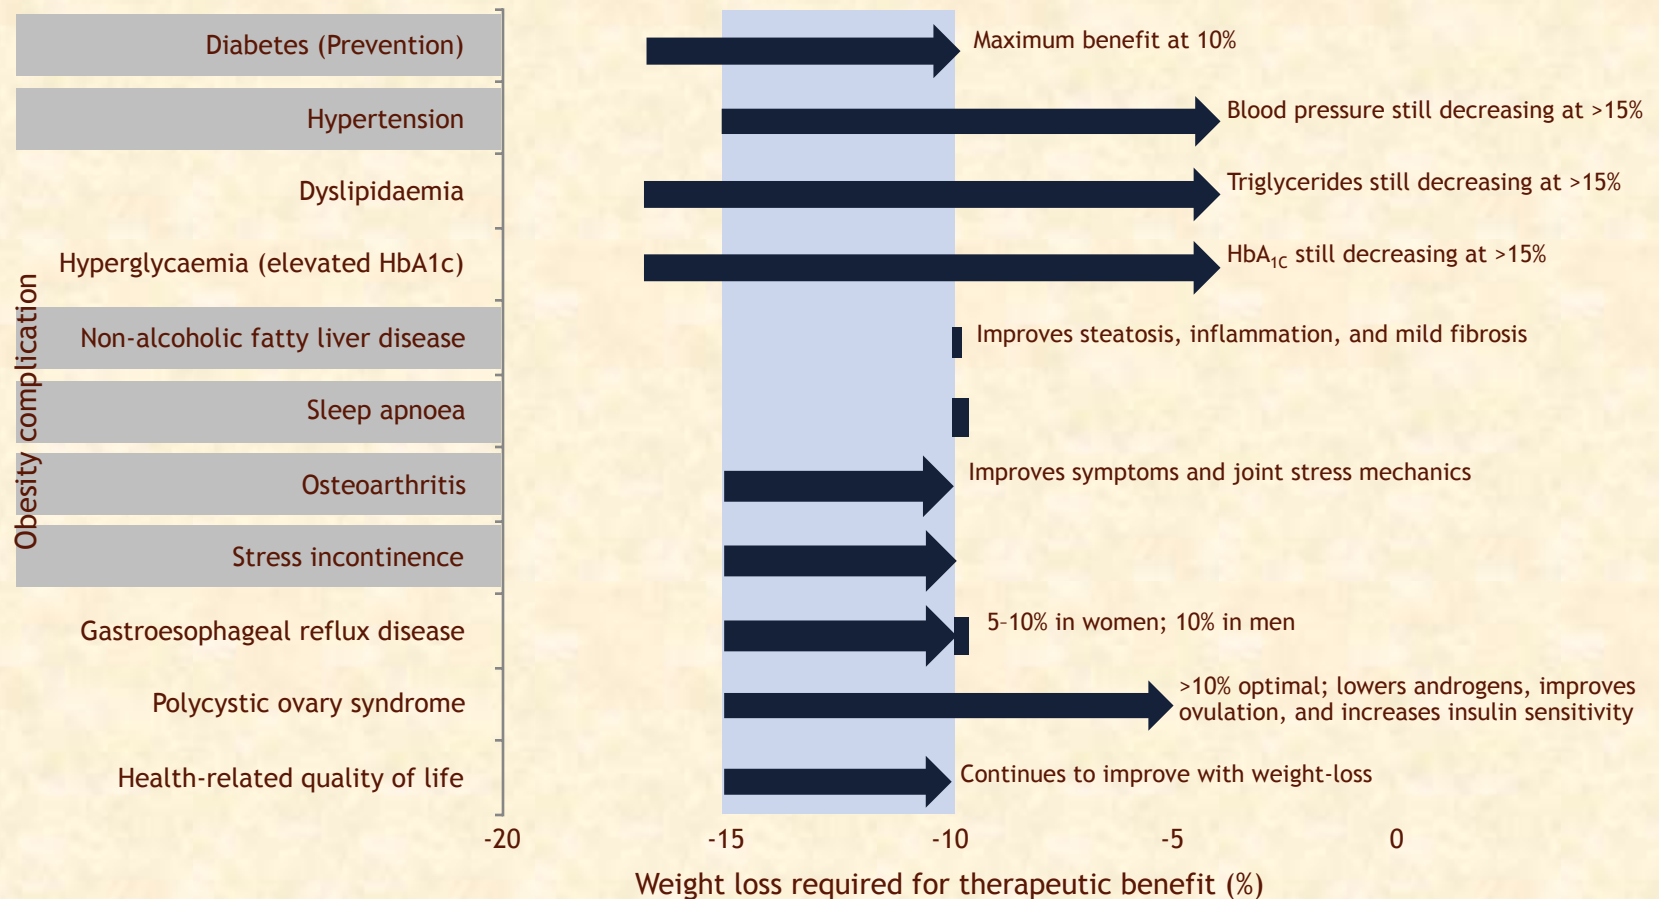

Surgery	2010	2001	1987	1821	1590	1260	760	422	169
Control	2037	2027	2016	1842	1455	1174	749	422	156

Figure 2. Unadjusted Cumulative Mortality.

The hazard ratio for subjects who underwent bariatric surgery, as compared with control subjects, was 0.76 (95% confidence interval, 0.59 to 0.99; $P=0.04$), with 129 deaths in the control group and 101 in the surgery group.

...the hazard ratio adjusted for sex, age, and risk factors was 0.71 ($P = 0.01$).

5-10% weight loss is clinically meaningful

The Plan

- A series of issues
- I will try to bring things into perspective
-

Conventional Thinking

vs

Modern Thinking

1) Everyone is different

- We knew that,
 - but what this really means is that the research is unpredictable
 - so we have to see the individual

Everything is a Bell Curve

2) Separating

GLUTTONY

DISEASE

Your Perception

- A patient with a disease
- Avoid judgement
- Is it there fault ?

What Really is Obesity ?

- A collection of disease processes
- Multiple processes may be at work in one individual, with additive effects
- Most are not reversible by simple means

But Even Gluttony

- Stress / Comfort eating

..at some point in our lives all of us will resort to food to make us feel better....

Allain de Botton

3) Genetics vs Environment

- We now live in an Obesio-genic Environment

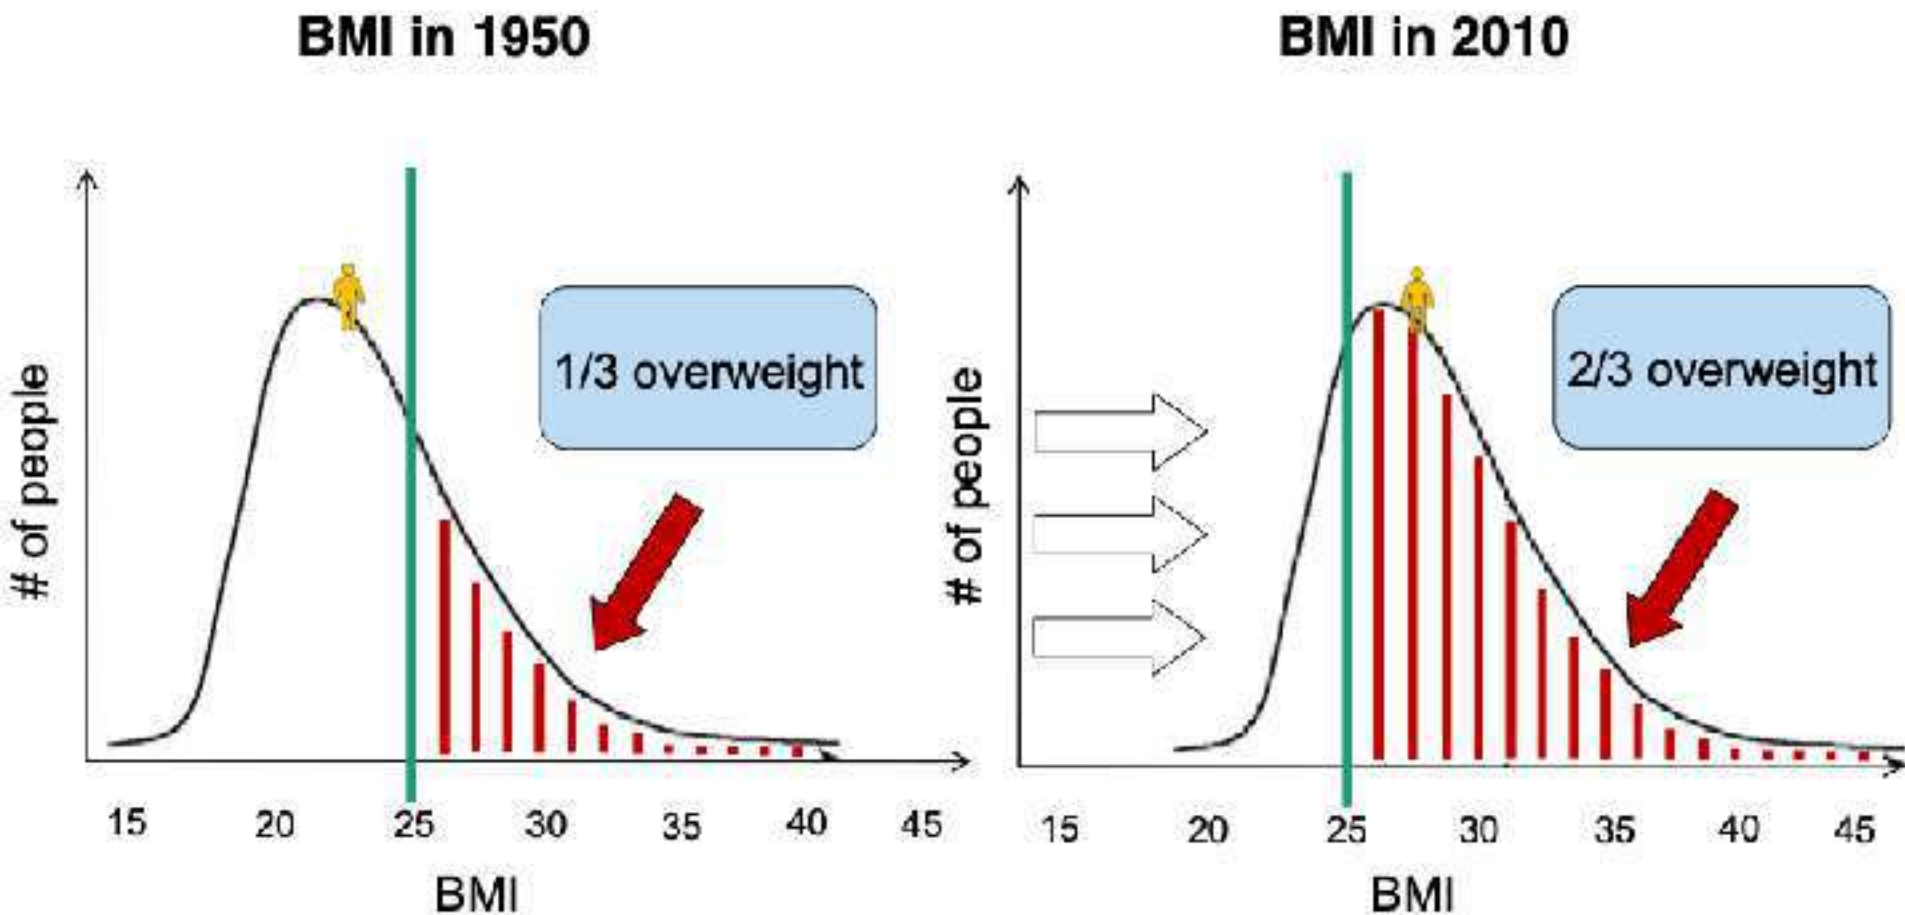

Environment

- Abundant Calorie Dense Food
- Bad social behaviours
- Eat to enjoy / Eat to live
- Diet in childhood

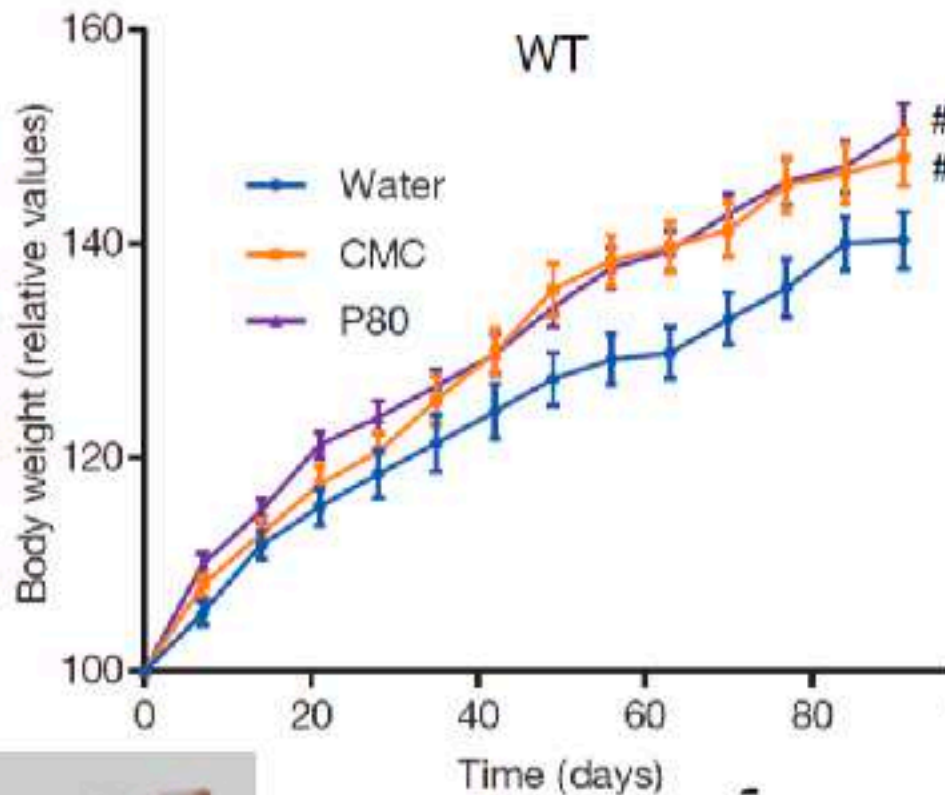

Genetic Susceptibility Influenced by the Environment

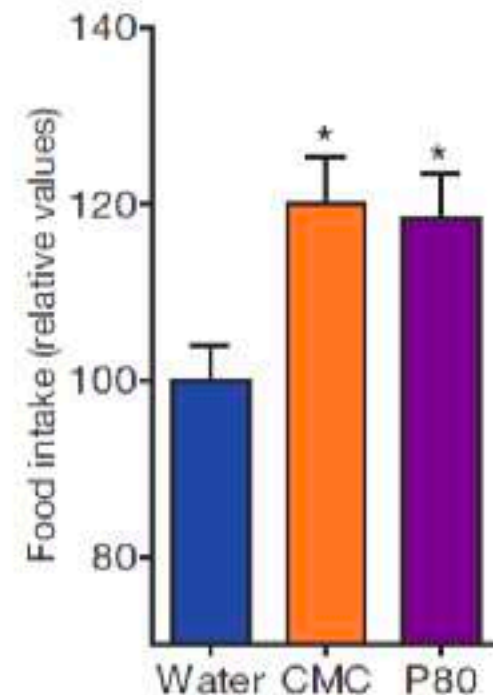

Genetic Susceptibility Influenced by the Environment

Food Emulsifiers Cause Increase in Appetite

CMC: Carboxy methyl cellulose
P80 : Polysorbate 80

Chassaing B, et al. Nature, 2015. PMID: 25731162

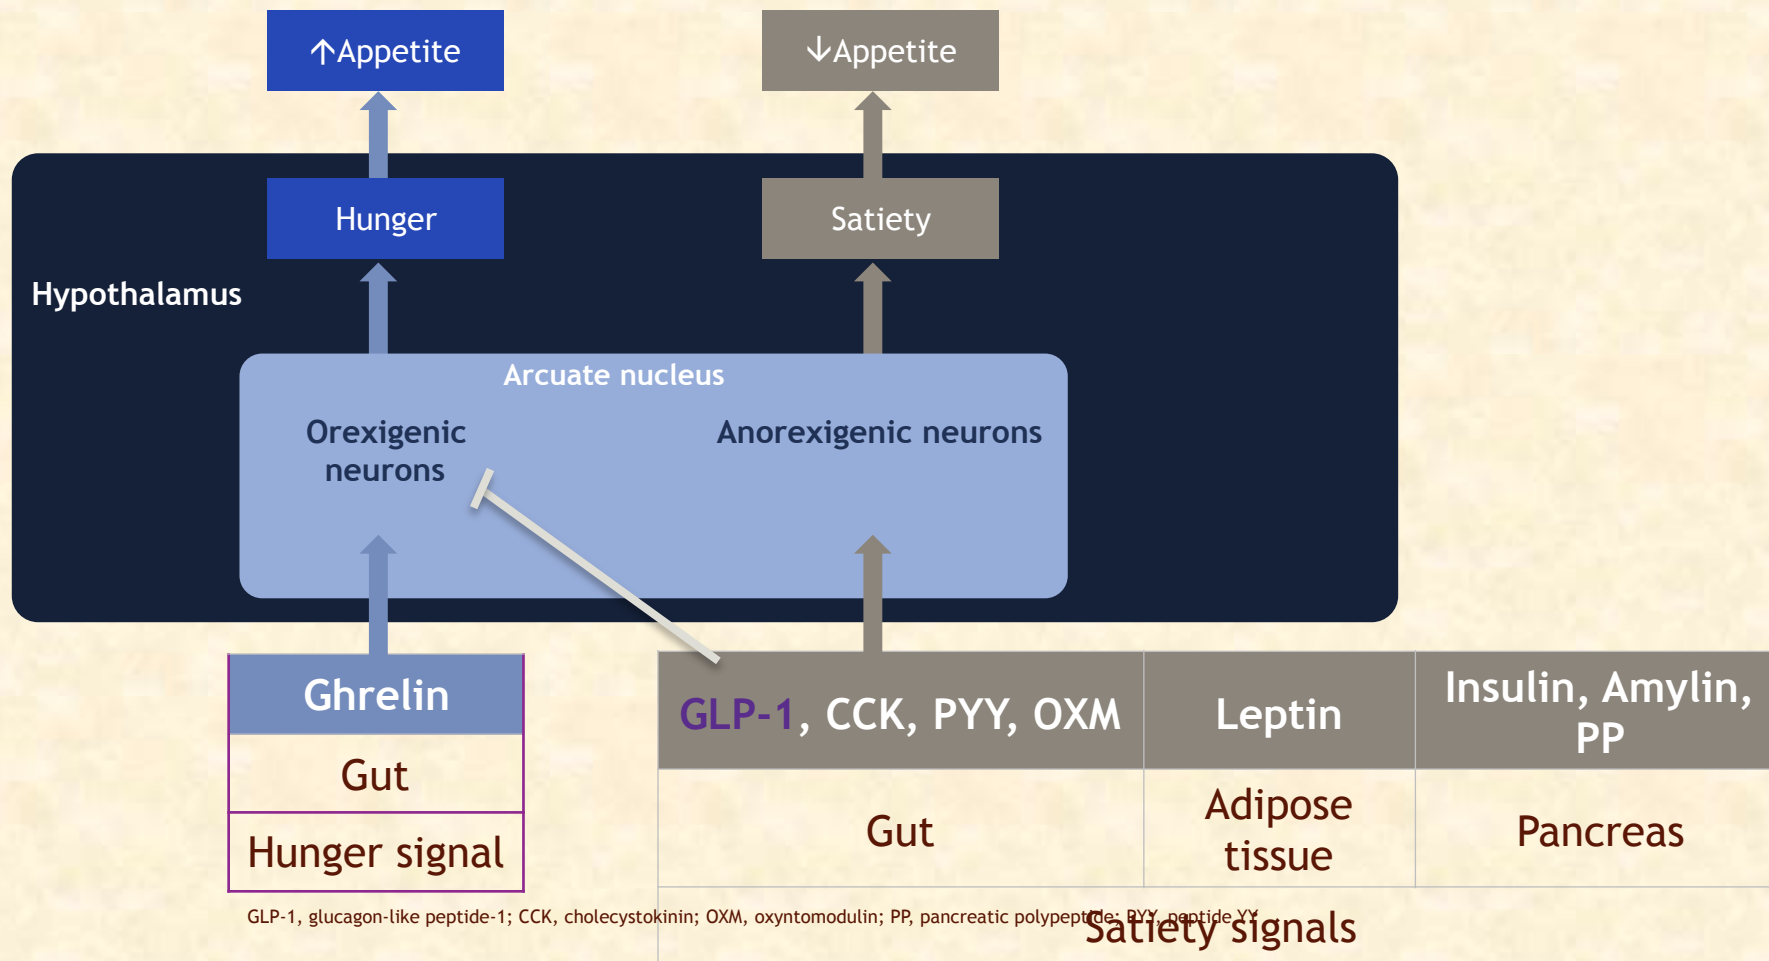

UNC
SCHOOL OF MEDICINE

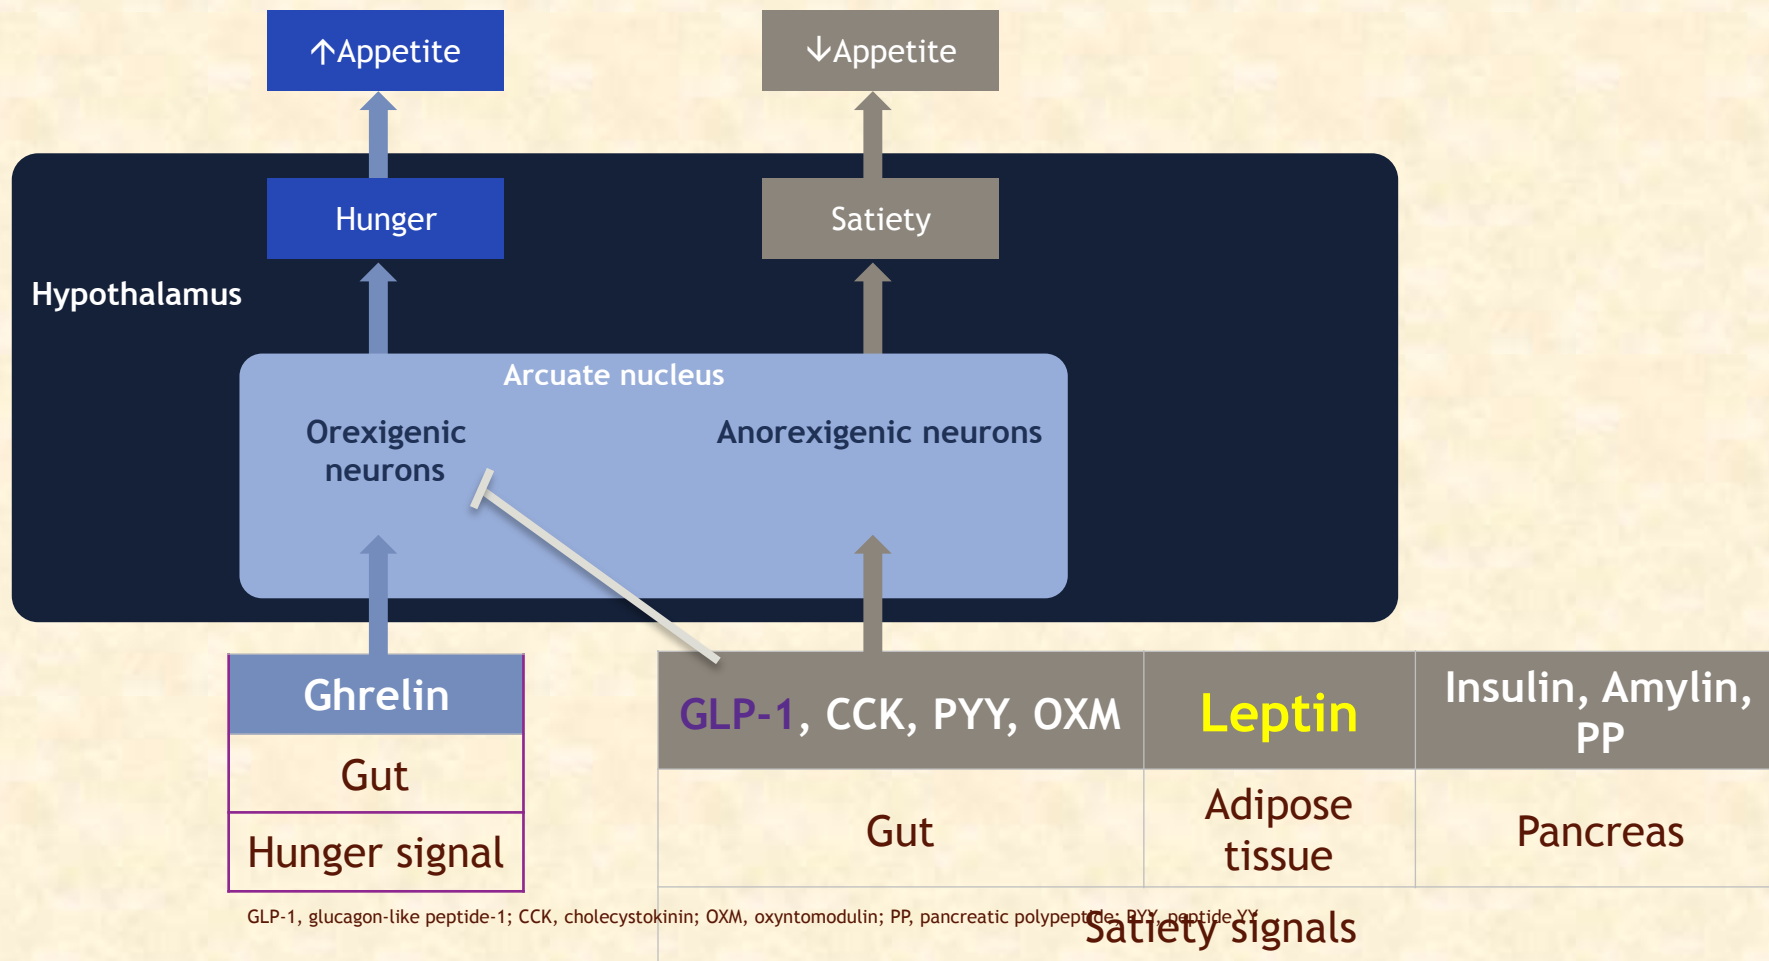

4) Weight regulation by the hypothalamus

- Set point in weight

THE HYPOTHALAMUS

THE HYPOTHALAMUS

4a) Outside Effectors

- High Fat Diet (Mouse Models)
 - causes inflammation and scarring in the hypothalamus
 - protected by exercise

High fat diet causes hypothalamic inflammation

JP Thaler et al., Diabetes, 2013

This can be seen on MRI

Exercise Reduces Inflammation Caused by High Fat Diet

Normal high
fiber diet

Normal food intake
No hypothal. Inflam.
No weight gain
Normal leptin signaling

Processed
high fat diet

↑ food intake
↑ Hypothal. Inflam.
↑ weight
↓ Leptin signaling

Processed
high fat diet + Running
wheel

Normal food intake
Reduced hypothal. Inflam.
No weight gain
Restored leptin signaling

Krawczewski, K., et al. Endocrinology 2011. PMID: 21586558

UNC
SCHOOL OF MEDICINE

4b) Body weight should be stable

- All about homeostasis
- Your body fights to keep your weight stable
- Your hypothalamus uses orexigenic hormones
 - To change behaviour to make you eat

Failure of dietary modalities.

“The best average weight loss achieved by the majority of diet interventions is 10kg all of which is regained within 6 months.”

NIH consensus statement.

Taking a Diet History

Retention rates of >60,000 Jenny Craig Clients after 1 year

5) Everyone lives within a range

- Normal for body weight fluctuations
 - Consider a holiday
 - Consider being healthy

Natural Variation and Zones of Lifestyle Opportunity

BMI

20 22 24 26 28 30 33 36 39 42 46 50 55 60

Excellent  Poor
Degree of Control

Our Medical Aim

- Keep people at the bottom end
 - At the healthy end
- Give general health advice
 - Eating / exercise
- But don't expect to get people out of the range without help

Reduced Metabolism

- Calories in = Calories out

A

Cold Exposure

Thermoneutral Conditions

What about therapies

- Weight loss varies from individual to individual
 - So what works for one person may not work for another

Weight Loss Varies Widely Among Patients

Diet (Low-carbohydrate)

Drug (Liraglutide)

Device (Duodenal liner)

Surgery (Gastric Bypass)

Anti Obesity Management Plan

Encourage Healthy Living

- Eat well
 - Exercise
 - Sleep well
 - Avoid Stress
-
- Psychological health / help

Sleep Hygiene

1. Avoid caffeine, nicotine, alcohol
2. Make bedroom sleep-inducing
3. Establish soothing pre-sleep routine
4. Go to bed when truly tired
5. Don't be a night-time clock-watcher
6. Use light to your advantage
7. Be consistent with sleep schedule
8. Nap early or not at all
9. Lighten up on evening meals
10. Balance fluid intake
11. Exercise early
12. Follow thru

Avoid Things That Cause Weight Gain

- Bad Social Behaviours
- Medication
 - causes 10% of obesity
- Other
 - Food Emulsifiers

Medications Causing Weight Gain

*Modified from W.S Leslie et al.
QJM 2007*

UNC
SCHOOL OF MEDICINE

and only then.....Specific Therapies

- Education
- Behavioural Change
- Medication
- Surgery

But

- We are happy to see anyone
- It all starts with a chat

Questions ?

Increased U.S. Overall Use of Antidepressants

7.7% in the past month (1999-2002) to 12.7% (2011-2014)

Adjusted Rate Ratios for $\geq 5\%$ Weight Gain

By Antidepressant Type

Considering the entire period of follow-up (10 years), participants who were prescribed an antidepressant had an increased risk of $\geq 5\%$ weight gain compared with those who had never been prescribed an antidepressant. This association was consistently observed across a wide range of population subgroups.

Adjusted Rate Ratios For $\geq 5\%$ Weight Gain *By Number of Prescriptions*

Adjusted Rate Ratios For $\geq 5\%$ Weight Gain *By Years of Antidepressant Treatment*

Drugs Associated With Weight Gain and Suggested Alternatives¹

Category	Drug Class	Weight Gain	Alternatives
Psychiatric agents	Antipsychotic	Clozapine, risperidone, olanzapine, quetiapine, haloperidol, perphenazine	Ziprasidone, aripiprazole
	Antidepressants/mood stabilizers: tricyclic antidepressants	Amytriptyline, doxepin, imipramine, nortriptyline, trimipramine, mirtazapine	Bupropion ^a , nefazodone, fluoxetine (short term), sertraline (<1 year)
	Antidepressants/mood stabilizers: SSRIs	Fluoxetine?, sertraline?, paroxetine, fluvoxamine	
	Antidepressants/mood stabilizers: MAOIs	Phenylzine, tranylcypromine	
	Lithium	—	
Neurologic agents	Anticonvulsants	Carbamazepine, gabapentin, valproate	Lamotrigine?, topiramate ^a , zonisamide ^a
Endocrinologic agents	Diabetes drugs	Insulin (weight gain differs with type and regimen used), sulfonylureas, thiazolidinediones, sitagliptin?, metiglinide	Metformin ^a , acarbose ^a , miglitol ^a , pramlintide ^a , edematide ^a , liraglutide ^a

^aWeight-reducing.

MAOI: monoamine oxidase inhibitor; SSRI: selective serotonin reuptake inhibitor.

1. Apovian CM et al. *J Clin Endocrinol Metab*. 2015;100:342-362.

But Remember

- Everyone is different
- Not everyone will increase weight
- Just like not everyone will respond

Think About Micronutrients

- Fat people have been dieting forever
- Dietary fads are bad

U.S Adults have Below Average Intake of Micronutrients

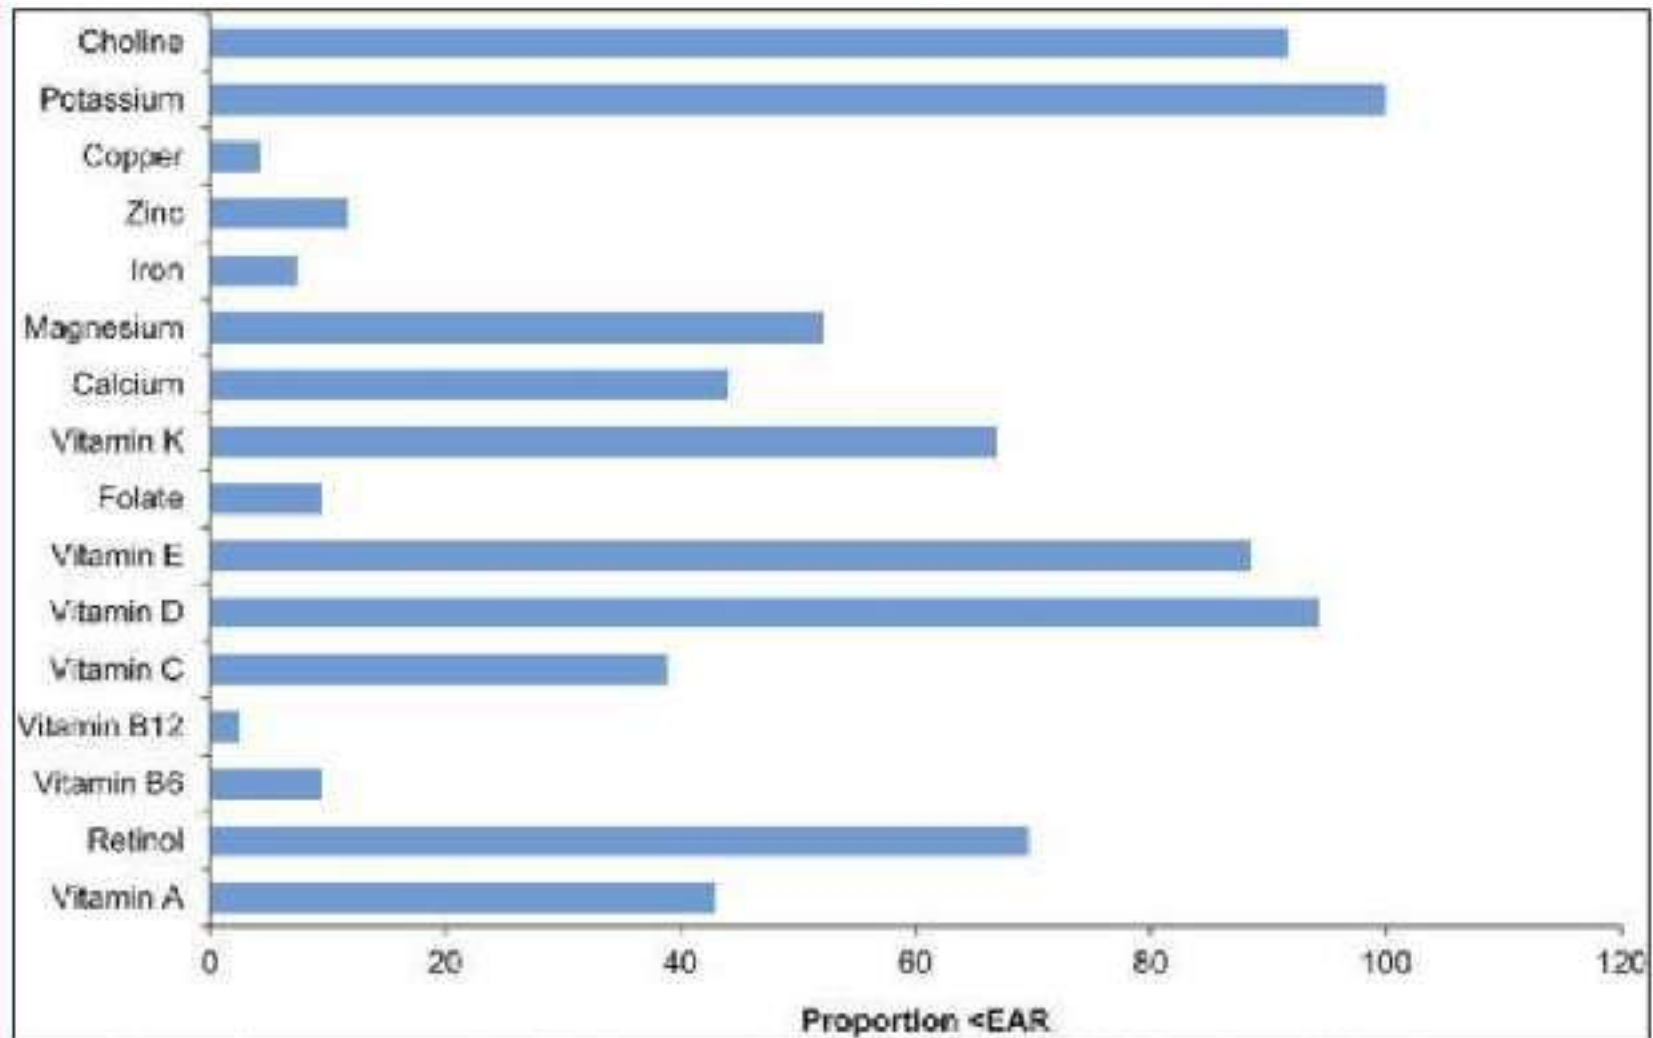

Figure 1. Percentage of Americans ≥ 1 years of age with selected micronutrient intakes from food alone <EAR (Wallace et al., 2014). EAR = estimated average requirement.

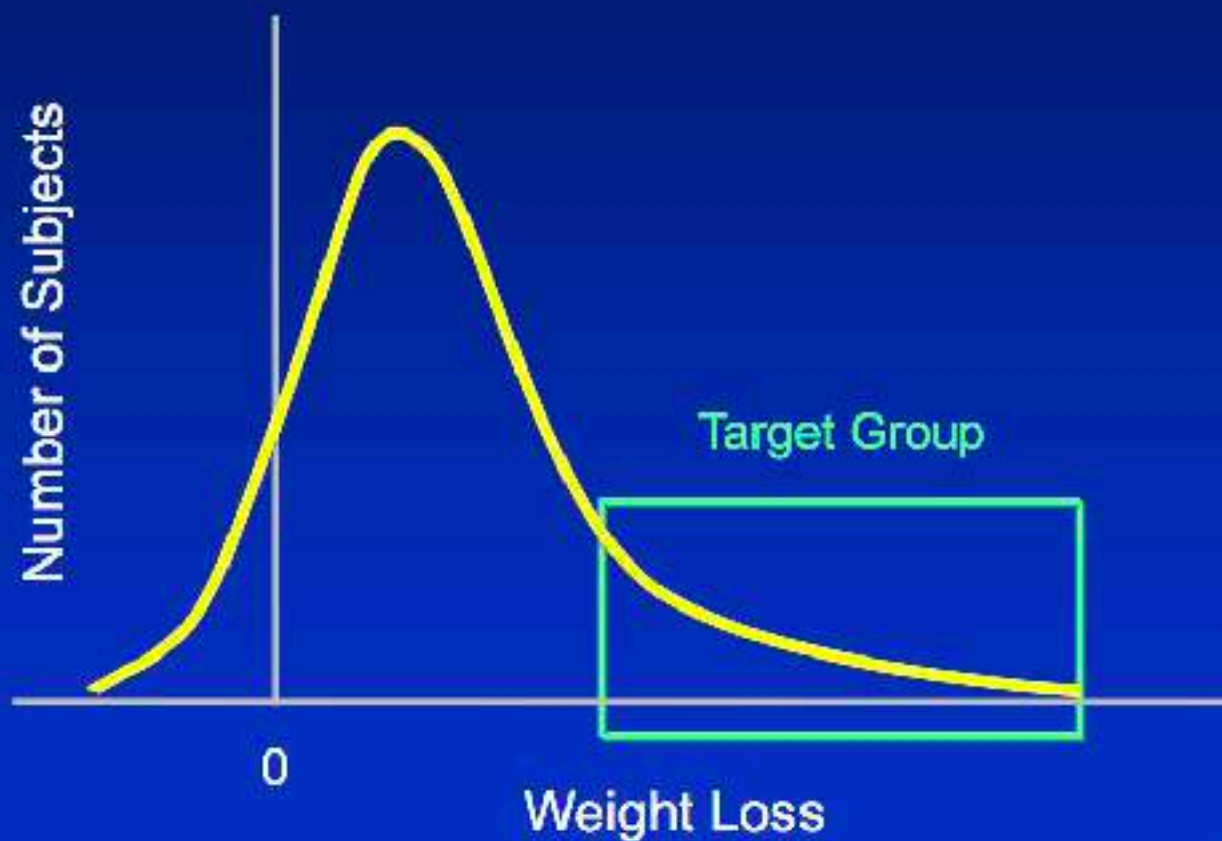

Medications for Weight Loss

- Four Available
- No Wrong / Wright choice
- Assess Response / Side effects
- Change if necessary
- Long term therapy is possible
- Expect 10% total body weight loss

Medications for Weight Loss

- May help people stay on a diet
- Use a dietitian / psychologist

Heterogeneity of Response

Saxenda (Liraglutide)

- CI - MEN / Pancreatitis
- Start with 0.6 ug and titrate up

Side effects

- Nausea
- Pancreatitis
- Cost - \$200-\$400/month

Duromine (Phenterimine)

- CI : IHD / Anxiety / Hypertension / Glaucoma

SIDE EFFECTS

- insomnia
- agitation
- hypertension

COST - \$80/month

Xenical (Orlistat)

- Safe (bit nasty)

SIDE EFFECTS

- diarrhoea
- flatulence

COST:

Contrave (Bupropion / Naltrexone)

- Seizures / Hypertension / Alcohol / MAO-I
- Expect 5% by 16 weeks
- CI: Seizures

SIDE EFFECTS

- Nausea / Constipation / Headache / Vomiting
- Dizziness /

COST : \$225 / month

Topiramate

- By itself or with Duromine
- Used for migraine control / smoking cessation
- CI - glaucoma / kidney stones

COST: PBS - Authority Script

Private -

Combinations of Therapies Are Generally Required for Effective Obesity Management

What about surgery ?

- It's not for everyone
- But

Who is an Operative Candidate?

- BMI > 35
- BMI 30- 35 + Obesity Co morbidity
- Age 18- 65*
- Reasonable attempts at weight loss >2 yrs
- Ability to comprehend implications of Surgery
- No Alcohol or Drug Dependency
- No desire to fall pregnant < 1yrs Post Op.
